

ABSTRACT

A computer peripheral with cable reeling device has a reeling device and an input device. The reeling device has a housing and a communication cable extensibly retracted in the housing. The communication cable has an
5 extractable end. The input device is detachably coupled with a front portion of the reeling device, and electrically connected with the reeling device. The reeling device can thereby couple with a computer peripheral and the communication cable is extendable. The reeling device can also be separated
10 from the computer peripheral for independent use.
